From obs.: "Walked out the north gate of Bridger to the playground. Just north of Texas meadows observed a slide that ran sometime earlier in the week on a E aspect. Seems to have been triggered naturally by a loose wet coming out of the steep rocky terrain above. Ran about 200 feet was about 50-60 feet wide and crown was roughly 2-3 feet deep. Snow around the slide and on similar aspects was wet in the top 40 cms or so." Photo: C. Bayles

Advisory Region
Bridger Range

Longitude
-110.93W
Latitude
45.83N
Avalanche Details: Wet slab north of Texas mdw, Bridgers
Bridger Range, 2024-03-24
