Quiet in the Tobacco Roots

Skiing

Long tour up the Noble Fork yesterday. The two feet of recent snow have much improved travel conditions. I noticed no bullseye signs of surface instabilities, asides from some old crowns on a very steep, north facing slope at treeline (~9000'). There was also some localized collapsing in windboard at higher elevations, and lots of rollerballs releasing from cliffs with solar aspects. I did not have time for a pit, so focused on avoiding connected avalanche terrain, and the runouts of larger solar paths.

Region
Out of Advisory Area
Location (from list)
Tobacco Root Mountains
Observer Name
Wyatt Hubbard
