

Surface Hoar and Instability in Lionhead

Date

Thu, 12/14/2023 - 06:35

Activity

Skiing

From email: 12/13: "Many slopes had half-inch to inch-sized [surface hoar](#) crystals on the surface, some of the largest I've ever seen!"

Wind was light out of the north on the ridgeline. We noticed 2 natural avalanches on the east-facing slopes below Bald Peak. I lost count, but we experienced well over 30+ collapses while walking on the ridgeline. Many of these collapses were very large and we were able to watch the slopes 'sink' by upwards of an inch which made our hair stand on end.

We dug a pit near the saddle below Lionhead Peak at 9300' on an east-facing slope (HS ~85cm). We performed an ECT and our results indicated poor [stability](#) (ECTP 14 @ 50cm)."

Region

Lionhead Range

Location (from list)

Lionhead Ridge

Observer Name

Robby Parsons
