Activity

Skiing

Snowboarding

Toured up from Pilot creek Parking lot, dug a pit on an eastern aspect. Had an ECT16 collapse on a layer ~20cm down, but no propagation in our ECTP test. A very weak layer ~25cm from the ground of facets was found in our 125cm deep pit. We did see avalanche debris about halfway up our intended line. Could not tell how recent it was due to heavy winds moving snow around. Due to windy conditions and avalanche activity, we decided to stop our ascent below the avalanche debris and ski back from there.

Region

Cooke City
