Activity

Skiing

Toured up above Bridger Bowl onto Bradley's Meadow and above and onto the Ramp. Coverage down low is very poor. Near the top of the Alpine lift and onto the Meadow, coverage is quite a bit better. Still some rocks and logs visible onto the Ramp but snow skied better than anticipated. We dug our pit at the top of the Meadow at 7800 ft at 82° E. It was 50 cm deep. There was a distinct crust at around 21 cm with a loose, semi sugary layer of snow just above it from 21-27cm above the ground. The rest of the snowpack above and below the crust and weak layer was about 1F in hand hardness.

Region

Bridger Range

Location (from list)

Bradley Meadow

Observer Name

Haylee Darby
