Activity

Skiing

GNFAC,

Skied Divide Peak today, ski conditions were off the chain! There was probably closer to 8" of low density fluff on the main face up high. Lots of hand pits didn't show any slab formation, just fluff on sun crust. We observed a lot of loose dry slides in steep terrain. There was a light breeze at the top mid-day, but not enough to form wind slabs, although there is plenty of snow for transport.

Thanks for everything you all do,

Spencer

Region

Northern Gallatin

Location (from list)

Divide Peak
