

Skier triggered hard wind slab at Bridger

Date

Sun, 11/27/2022 - 14:15

Activity

Skiing

Skier triggered [wind slab](#) avalanche around 2pm, along the edge of north Bowl and Bronco near "The John". Crown 6-10" deep and 30 feet wide, hard [slab](#) of recent drifted snow. HS-ASc-D1.5. Strong wind blowing steady from the south-southwest and transporting snow, filling in tracks rapidly.

Immediately after this [slide](#), I saw what I assume was skier triggered, [slide](#) of similar size a little further down the bowl with crown drifting in. Beacon check of debris produced no signal, barely deep enough to bury someone.

Region

Bridger Range

Location (from list)

Bridger Bowl
