

Mt Ellis (main summit)

Date

Fri, 12/02/2022 - 06:05

Activity

Skiing

Experienced no signs of snow instabilities. Ellis has apparently seen limited amount of wind as only scattered signs of drifting were noted. SW Montana faceted snow exist at the ground with the snow above in a right side up configuration. The skiing was excellent, some of the steeper lines were skied and only minor surface sluffes were initiated.

Region

Northern Gallatin

Location (from list)

Mt Ellis
