

Small nat. avalanches in Flanders

Flanders Creek
Northern Gallatin
2/14/2023
Code
SS-N-D1
Latitude
45.44020
Longitude
-110.93100
Notes

Went for a ski up the Flanders drainage in Hyalite today. The day was punctuated by light winds and heavy snowfall.

On the skin in, we noted numerous D1 storm [slab](#) avalanches about 15cm down in the new snow on many aspects and elevations. Approaching a ridgeline, we experienced a shooting crack that propagated a very small [slide](#) in slightly wind affected snow. We dug an ECT on a SE facing [aspect](#) at 9000ft. We were unable to get [propagation](#). Snow totals appeared to be higher than forecasted, with 60cm of new snow as of about 12:30. By the time we ripped skins, the area had received an additional 10cm of snow, putting totals around 60-70cm of low density snow on top of a stout melt freeze crust on the [aspect](#) we were skiing.

we did not observe any cracking collapsing or wumpling in buried weak layers, nor signs of avalanches on those layers. The new snow had very low SWE.
