

Bridger Bowl

Date

Mon, 11/18/2024 - 16:10

Activity

Skiing

Dug a snow pit on a northern aspect at Bridger Bowl around 7800ft of elevation. Snow depth ranged from 45-50cm. Had a very reactive CT 2 on the most recent snow layer around 25cm deep in the snow measured from the ground up. Attempted a hasty ECT before we lost sunlight but did not get propagation. There was visible wind loading on upper elevations as well.

Region

Bridger Range

Location (from list)

Bridger Bowl

Observer Name

Simon MacLean
