

# The effect of changing slope angle on comp

This is an avalanche triggered by two experienced avalanche forecasters while digging a snow pit. Conducting stability tests in avalanche terrain is inherently dangerous since it exposes the observer to the potential of being caught in an avalanche.

Dataset 1, Montana,  $p = 0.67$

Our fieldwork shows no significant cha

We tested the effect of slope angle on compression tests (CTs) using similar methods as recent ECT work. We collected field data on three separate days with persistent weak layers. Our slopes exhibited gradual changes in steepness, allowing us to sample a variety of slope angles with minimal snow structure changes.

<sup>3</sup>Gallatin National Forest Avalanche C

Utilizing SnowPilot data, we analyzed the correlation between the diff propagating ECTs and CTs on the same layer and slope angle. The relat sample ( $n = 534$ ) is not statistically significant ( $p = 0.19$ ), reinforcing ou
